EXPERIMENT 1: BASIC NETWORKING COMMANDS

AIM:

To study and execute basic networking commands used to inspect network configuration and test connectivity.

PROCEDURE:

1. Open Command Prompt in Windows or Terminal in Linux.
2. Execute the required commands one by one.
3. Observe IP configuration, routing information, DNS lookup and connectivity details.
4. Compare the information returned by the commands.
5. Check the command syntax using the built-in help option when required.
6. Record the important values returned by each command, such as interface name, IP address and route.
7. Repeat connectivity tests after confirming that the network interface is enabled.

CODE:

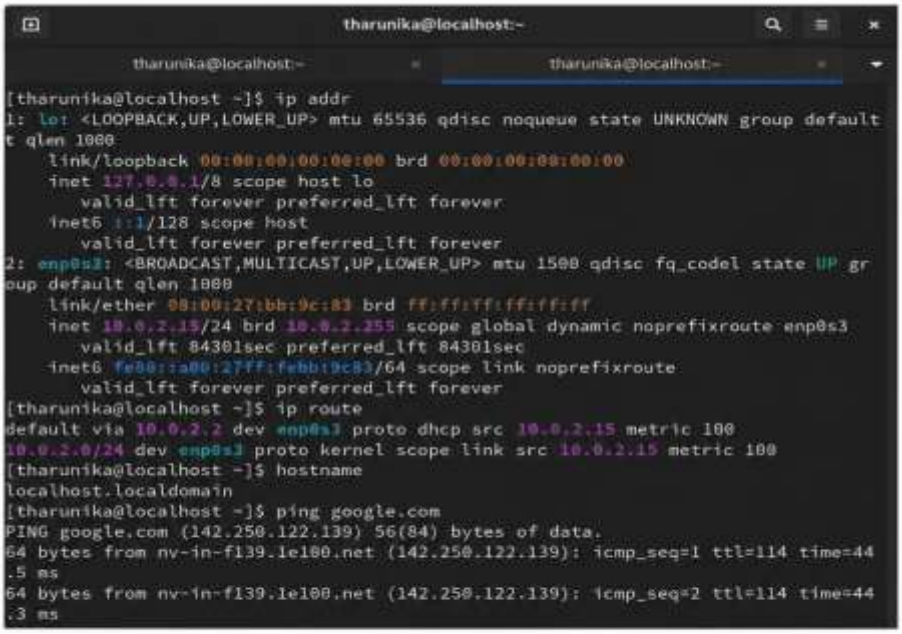

```
Windows:
ipconfig /all
hostname
arp -a
netstat -ano
nslookup example.com
ping 127.0.0.1
route print

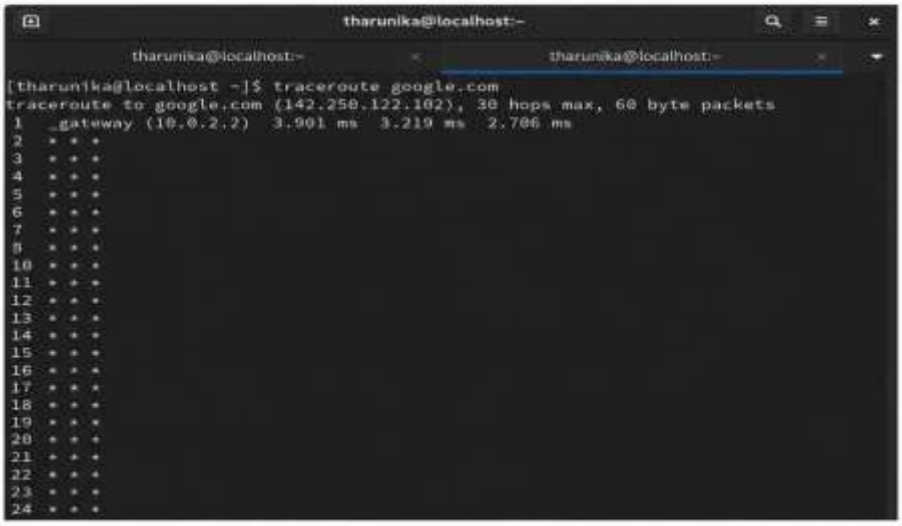

Linux:
ip address show
ip route show
ip neigh
ss -tuln
```

```
nslookup example.com
ping -c 4 127.0.0.1
```

OUTPUT:

RESULT:

Thus, basic networking commands were executed and their use in checking configuration, routing, DNS and connectivity was studied.
