EXPERIMENT 2: LEARNING AND ASSIGNMENT OF IP ADDRESS MANUALLY

AIM:

To manually assign IPv4 addresses to hosts and verify connectivity between them.

PROCEDURE:

1. Connect two computers to the same switch, or add two PCs and a switch in Cisco Packet Tracer.

2. Open the IPv4 settings of each host and select manual/static configuration.

3. Assign addresses in the same subnet with a suitable subnet mask.

4. Save the settings and open the command prompt on the first host.

5. Ping the second host and verify the result.

6. Ensure that both hosts use unique IP addresses and that no other device on the LAN uses the same address.
7. Check that the Ethernet cable or virtual Packet Tracer links are connected and active.
8. If the ping test fails, verify the subnet mask, firewall settings, cabling and default gateway.

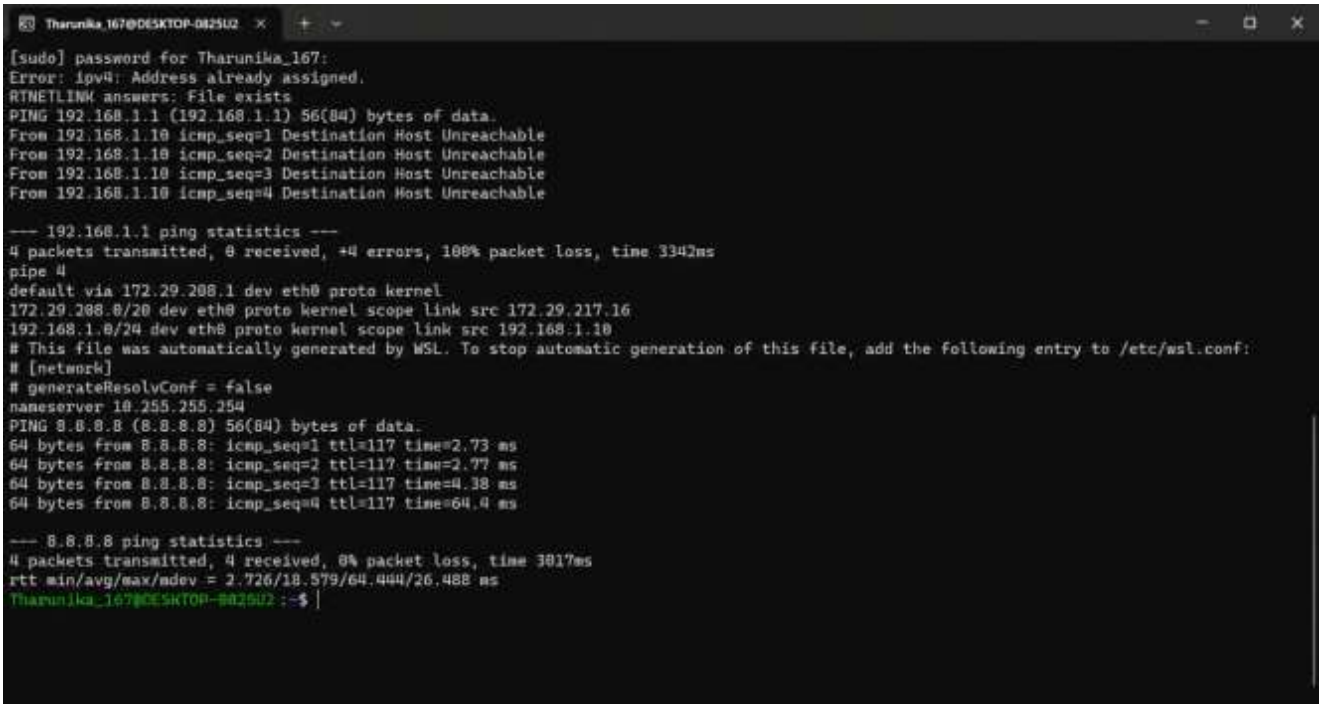

CODE:

```
Host 1:
IP Address : 192.168.10.1
Subnet Mask: 255.255.255.0

Host 2:
IP Address : 192.168.10.2
Subnet Mask: 255.255.255.0

Connectivity test from Host 1:
ping 192.168.10.2
```

OUTPUT:

RESULT:

Thus, static IP addresses were assigned manually and connectivity between hosts in the same subnet was tested.
